

Software Quality Assurance

(Lecture 14)

Dr. R. Mall

Organization of this Lecture:

- ⌘ Introduction Quality Engineering.
- ⌘ Quality control and Quality Assurance
- ⌘ ISO 9000
- ⌘ SEI CMM
- ⌘ Summary

Introduction

⌘ Traditional definition of quality:

⌘ fitness of purpose,

⌘ a quality product does exactly what the users want it to do.

Fitness of purpose

- ⌘ For software products,
 - ☑ fitness of purpose:
 - ☒ satisfaction of the requirements specified in SRS document.

Fitness of purpose

⌘ A satisfactory definition of quality for many products:

☑ a car, a table fan, a food mixer, microwave oven, etc.

⌘ But, not satisfactory for software products.

Introduction

⌘ Consider a software product:

- ☑ functionally correct,

 - ☒ i.e. performs all functions as specified in the SRS document,

- ☑ but has an almost unusable user interface.

 - ☒ cannot be considered as a quality product.

Introduction

⌘ Another example:

- ☐ a product which does everything that users want.

- ☐ but has an almost incomprehensible and unmaintainable code.

Modern view of quality

⌘ Associates several quality factors with a software product :

- ☑ Correctness
- ☑ Reliability
- ☑ Efficiency (includes efficiency of resource utilization)
- ☑ Portability
- ☑ Usability
- ☑ Reusability
- ☑ Maintainability

Correctness

⌘ A software product is correct,

☑ if different requirements as specified in the SRS document have been correctly implemented.

☑ Accuracy of results.

Portability

⌘ A software product is said to be portable,

- ☑ if it can be easily made to work in different operating systems,

- ☑ in different machines,

- ☑ with other software products, etc.

Reusability

⌘ A software product has good reusability,

☑ if different modules of the product can easily be reused to develop new products.

Usability

- ⌘ A software product has good usability,
 - ☑ if different categories of users (i.e. both expert and novice users) can easily invoke the functions of the product.

Maintainability

- ⌘ A software product is maintainable,
 - ☑ if errors can be easily corrected as and when they show up,
 - ☑ new functions can be easily added to the product,
 - ☑ functionalities of the product can be easily modified, etc.

Software Quality Management System

⌘ Quality management system
(or quality system):

☐ principal methodology used
by organizations to ensure that
the products have desired
quality.

Quality system

⌘ A quality system consists of the following:

- ☑ Managerial Structure

- ☑ Individual Responsibilities.

⌘ Responsibility of the organization as a whole.

- 
- ⌘ The quality system encompass the following ;
 - ⌘ Auditing of projects
 - ⌘ Review of the quality system
 - ⌘ Development of standard
 - ⌘ Production of reports for the top management summarizing the effectiveness of quality system.

Quality system

- ⌘ Every quality conscious organization has an independent quality department:
 - ☑ performs several quality system activities.
 - ☑ needs support of top management.
 - ☑ Without support at a high level in a company,
 - ☒ many employees may not take the quality system seriously.

Quality System Activities:

- ⌘ Auditing of projects
- ⌘ Development of:
 - ☐ standards, procedures, and guidelines, etc.
- ⌘ Production of reports for the top management
 - ☐ summarizing the effectiveness of the quality system in the organization.
- ⌘ Review of the quality system itself.

Quality system

⌘ A good quality system must be well documented.

☐ Without a properly documented quality system,

☒ application of quality procedures become ad hoc,

☒ results in large variations in the quality of the products delivered.

Quality system

⌘ An undocumented quality system:

- ☑ sends clear messages to the staff about the attitude of the organization towards quality assurance.

⌘ International standards such as ISO 9000 provide:

- ☑ guidance on how to organize a quality system.

Evolution of Quality Systems

⌘ Quality systems have evolved:

☑ over the last five decades.

⌘ Prior to World War II,

☑ way to produce quality products:

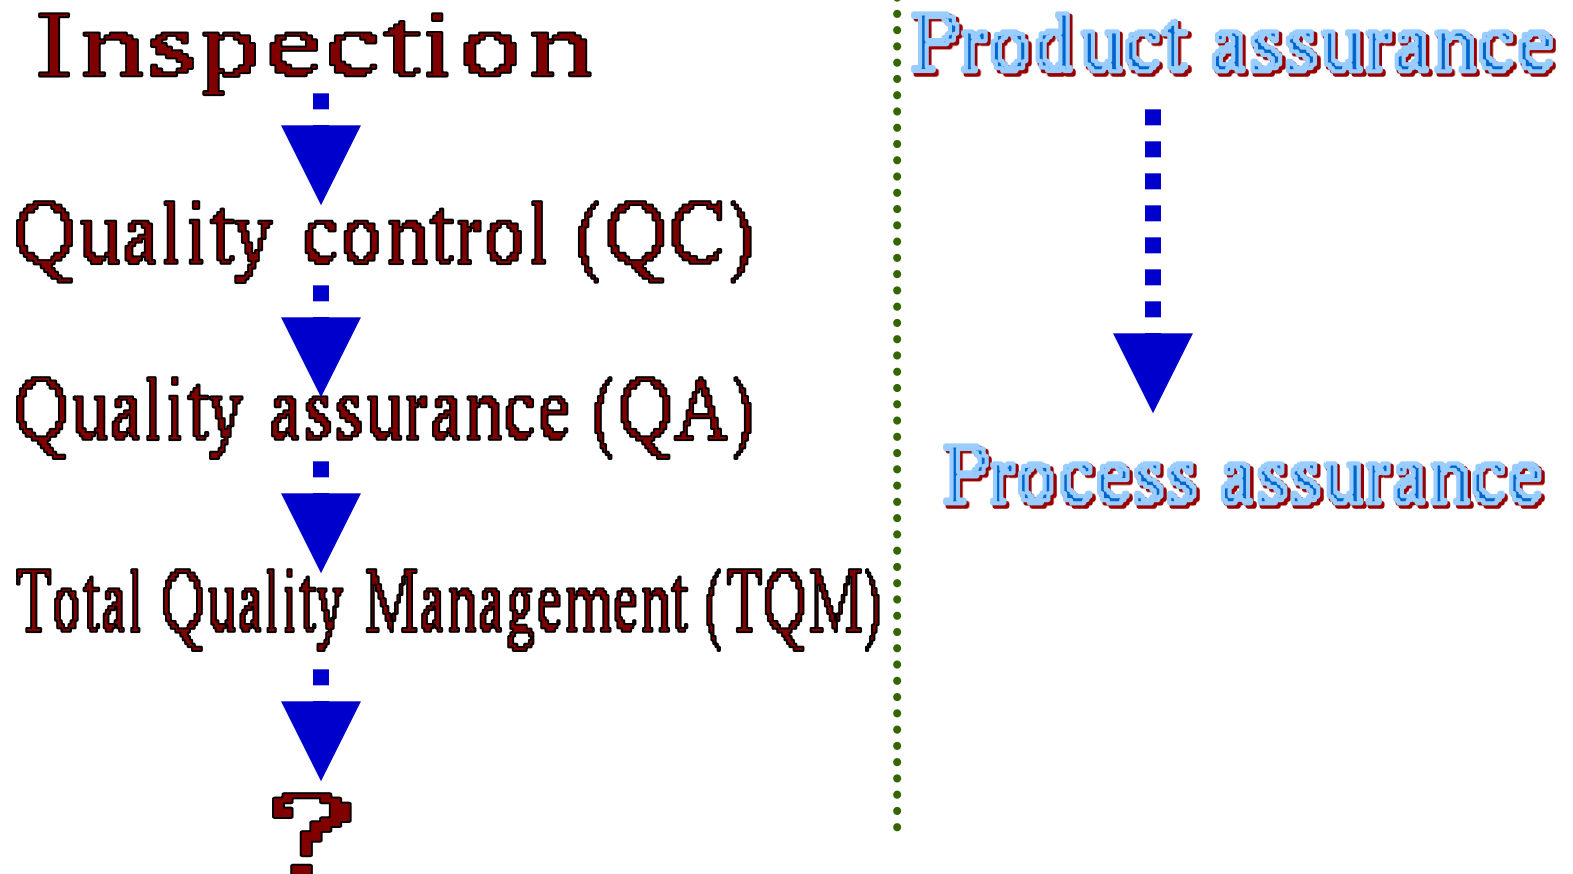

☒ inspect the finished products

☒ eliminate defective products.

Evolution of Quality Systems

- ⌘ Since that time,
 - ▢ quality systems of organizations have undergone
 - ▢ four stages of evolution.

Evolution of Quality Systems

Evolution of Quality Systems

⌘ Initial product inspection method :

☐ gave way to **quality control (QC)**.

⌘ Quality control:

☐ not only detect the defective products and eliminate them

☐ but also determine the causes behind the defects.

Quality control (QC)

⌘ Quality control aims at correcting the causes of errors:

☑ not just rejecting defective products.

⌘ Statistical quality control

☑ quality of the output of the process is inferred using statistical methods

☑ in stead of inspection or testing of all products

Quality control (QC)

- ⌘ The next breakthrough,
 - ▢ development of quality assurance principles

Quality assurance

⌘ Basic premise of modern quality assurance:

- ☑ if an organization's processes are good and are followed rigorously,
- ☒ the products are bound to be of good quality.

Quality assurance

⌘ All modern quality paradigms include:

☑ guidance for recognizing, defining, analyzing, and improving the production process.

Total quality management (TQM)

⌘ Advocates:

▣ continuous process improvements through process measurements.

Business Process reengineering

- ⌘ A term related to TQM.
- ⌘ Process reengineering goes a step further than quality assurance:
 - ⏏ aims at continuous process improvement.

Business Process reengineering

- Our focus is reengineering of the software process.
- Whereas BPR aims at reengineering the way business is carried out in any organization
 - not just software development organizations.

Total quality management (TQM)

⌘ TQM goes beyond documenting processes

☐ optimizes them through redesign.

⌘ Over the years the quality paradigm has shifted:

☐ from product assurance to process assurance.

ISO 9000

⌘ ISO (International Organization for Standardization):

☐ a consortium of 63 countries established to formulate and foster standardization.

⌘ ISO published its 9000 series of standards in 1987.

What is ISO 9000 Certification?

⌘ ISO 9000 certification:

☑ serves as a reference for contract between independent parties.

⌘ The ISO 9000 standard:

☑ specifies guidelines for maintaining a quality system.

What is ISO 9000 Certification?

⌘ ISO 9000 specifies:

- ☑ guidelines for repeatable and high quality product development.

- ☑ Also addresses organizational aspects

 - ☑ responsibilities, reporting, procedures, processes, and resources for implementing quality management.

ISO 9000

⌘ A set of guidelines for the production process.

☑ not directly concerned about the product it self.

☑ a series of three standards:

☒ ISO 9001, ISO 9002, and ISO 9003.

ISO 9000

⌘ Based on the premise:

☐ if a proper process is followed
for production:

☒ good quality products are
bound to follow.

ISO 9001:

⌘ Applies to:

☑ organizations engaged in design, development, production, and servicing of goods.

☑ applicable to most software development organizations.

ISO 9002:

⌘ ISO 9002 applies to:

- ⌘ organizations who do not design products:
 - ⌘ but are only involved in production.

⌘ Examples of this category of industries:

- ⌘ steel or car manufacturing industries
- ⌘ buy the product and plant designs from external sources:
 - ⌘ only manufacture products.
- ⌘ not applicable to software development organizations.

ISO 9003

⌘ ISO 9003 applies to:

☑ organizations involved only in installation and testing of the products.

ISO 9000 for Software Industry

⌘ ISO 9000 is a generic standard:

- ☐ applicable to many industries,

- ☒ starting from a steel manufacturing industry to a service rendering company.

⌘ Many clauses of ISO 9000 documents:

- ☐ use generic terminologies

- ☐ very difficult to interpret them in the context of software organizations.

Software vs. other industries

- ⌘ Very difficult to interpret many clauses for software industry:
 - ☐ software development is radically different from development of other products.

Software vs. other industries

⌘ Software is intangible

⏏ therefore difficult to control.

⏏ It is difficult to control anything that we cannot see and feel.

⏏ In contrast, in a car manufacturing unit:

⏏ we can see a product being developed through stages such as fitting engine, fitting doors, etc.

⏏ one can accurately tell about the status of the product at any time.

⏏ Software project management is an altogether different ball game.

Software vs. other industries

⌘ During software development:

☑ the only raw material consumed is data.

⌘ For any other product development:

☑ Lot of raw materials consumed

☒ e.g. Steel industry consumes large volumes of iron ore, coal, limestone, etc.

⌘ ISO 9000 standards have many clauses corresponding to raw material control .

☒ not relevant to software organizations.

Software vs. other industries

⌘ Radical differences exist between software and other product development,

☒ difficult to interpret various clauses of the original ISO standard in the context of software industry.

ISO 9000 Part-3

- ⌘ ISO released a separate document called ISO 9000 part-3 in 1991
 - ☑ to help interpret the ISO standard for software industry.
- ⌘ At present,
 - ☑ official guidance is inadequate

Why Get ISO 9000 Certification?

⌘ Several benefits:

- ☑ Confidence of customers in an organization increases

- ☑ if organization qualified for ISO 9001 certification.

- ☑ This is especially true in the international market.

Why Get ISO 9000 Certification?

- ⌘ Many international software development contracts insist:
 - ☑ development organization to have ISO 9000 certification.

Why Get ISO 9000 Certification?

⌘ Requires:

- ☑ a well-documented software production process to be in place.
- ☑ contributes to repeatable and higher quality software.

⌘ Makes development process:

- ☑ focussed, efficient, and cost-effective

Why Get ISO 9000 Certification?

- ⌘ Points out the weakness of an organizations:
 - ☐ recommends remedial action.
- ⌘ Sets the basic framework:
 - ☐ for development of an optimal process and TQM.

How to Get ISO 9000 Certification?

⌘ An organization intending to obtain ISO 9000 certification:

☐ applies to a ISO 9000 registrar for registration.

⌘ ISO 9000 registration process consists of several stages.

How to Get ISO 9000 Certification?

⌘ Application stage:

☑ Applies to a registrar for registration.

⌘ Pre-assessment:

☑ the registrar makes a rough assessment of the organization.

How to Get ISO 9000 Certification?

⌘ Document review and adequacy audit:

- ☑ process and quality-related documents.
- ☑ the registrar reviews the documents
- ☑ makes suggestions for improvements.

How to Get ISO 9000 Certification?

- Compliance audit: the registrar checks
 - whether the suggestions made by it during review have been complied.

How to Get ISO 9000 Certification?

⌘ Registration:

- ☑ The registrar awards ISO 9000 certificate after successful completions of all previous phases.

⌘ Continued surveillance:

- ☑ The registrar continues monitoring the organization periodically.

ISO 9000 Certification

- ⌘ An ISO certified organization
 - ☑ can use the certificate for corporate advertizements
 - ☑ cannot use the certificate to advertize products.
 - ☒ ISO 9000 certifies organization's process
 - ☒ not any product of the organization.
 - ☑ An organization using ISO certificate for product advertizements:
 - ☒ risks withdrawal of the certificate.

Summary of ISO 9001 Requirements

⌘ Management responsibility(4.1):

- ☑ Management must have an effective quality policy.
- ☑ The responsibility and authority of all those whose work affects quality:
 - ☒ must be defined and documented.

Management responsibility(4.1)

⌘ Responsibility of the quality system.

- ☐ independent of the development process,

- ☐ can work in an unbiased manner.

⌘ The effectiveness of the quality system:

- ☐ must be periodically by audited.

Quality system (4.2) and contract reviews (4.3):

⌘ A quality system must be maintained and documented.

⌘ Contract reviews (4.3):

☑ Before entering into a contract, an organization must review the contract

☒ ensure that it is understood,

☒ organization has the capability for carrying out its obligations.

Design control (4.4):

- ⌘ The design process must be properly controlled,
 - ☒ this includes controlling coding also.
- ⌘ A good configuration control system must be in place.

Design control (4.4):

- ⌘ Design inputs must be verified as adequate.
- ⌘ Design must be verified.
- ⌘ Design output must be of required quality.
- ⌘ Design changes must be controlled.

Document control (4.5):

- ⌘ Proper procedures for
 - ☑ document approval, issue and removal.
- ⌘ Document changes must be controlled.
 - ☑ use of some configuration management tools is necessary.

Purchasing (4.6):

⌘ Purchased material, including bought-in software:

☑ must be checked for conforming to requirements.

Purchaser Supplied Products (4.7):

⌘ Material supplied by a purchaser,

☐ for example,

☒ client-provided software must be properly managed and checked.

Product Identification (4.8):

⌘ The product must be identifiable at all stages of the process.

☑ In software development context this means configuration management.

Process Control (4.9) :

- ⌘ The development must be properly managed.
- ⌘ Quality requirements must be identified in a quality plan.

Inspection and Testing (4.10) :

⌘ In software terms this requires effective testing i.e.,

☑ unit testing, integration testing and system testing.

⌘ Test records must be maintained.

Inspection, measuring and test equipment(4.11):

- ⌘ If integration, measuring, and test equipments are used,
 - ☑ must be properly maintained and calibrated.

Control of nonconforming product (4.13) :

- ⌘ In software terms,
 - ☒ keeping untested or faulty software out of released product,
 - ☒ or other places whether it might cause damage.

Corrective Action (4.14) :

⌘ This is both about correcting errors when found,

- ☐ investigating why they occurred

- ☐ improving the process to prevent further occurrences.

⌘ If an error reoccurs despite the quality system,

- ☐ the system needs improvement.

Handling (4.15) and Quality audits (4.17):

⌘ Handling (4.15) Deals with:

☒ storage, packing, and delivery of the software product.

⌘ Quality Audits (4.17) :

☒ quality system audit must be carried out to ensure its effectiveness.

Training (4.18) :

- ⌘ Training needs must be identified and met.
- ⌘ Most items of ISO standard
☑ are largely common sense.

Salient features of ISO 9001 requirements:

- ⌘ All documents concerned with the development of a software product
 - ☑ should be properly managed, authorized, and controlled.
- ⌘ Proper plans should be prepared
 - ☑ progress against these plans should be monitored.

Salient features of ISO 9001 requirements:

- ⌘ Important documents independently checked and reviewed:
 - ☑ for effectiveness and correctness.
- ⌘ The product should be tested :
 - ☑ against specification.
- ⌘ Several organizational aspects:
 - ☑ e.g., management reporting of the quality team.

Shortcomings of ISO 9001 Certification (1)

⌘ ISO 9000 requires a production process to be adhered to:

☐ but does not guarantee the process to be of high quality.

☐ Does not give any guideline for defining an appropriate process.

Shortcomings of ISO 9001 Certification (2)

⌘ ISO 9000 certification process

- ☐ not fool-proof

- ☐ no international accreditation agency exists.

- ☐ likely variations in the norms of awarding certificates:

 - ☒ among different accreditation agencies and among the registrars.

Shortcomings of ISO 9001 Certification (3)

⌘ Organizations qualifying for ISO 9001 certification:

- ☒ tend to downplay domain expertise.

- ☒ tend to believe that since a good process is in place,

- ☒ any engineer is as effective as any other engineer in doing any particular activity relating to software development.

Shortcomings of ISO 9001 Certification (4)

- ⌘ In manufacturing industry
 - ☑ clear link between process quality and product quality
 - ☑ once a process is calibrated:
 - ☒ can be run again and again producing quality goods
- ⌘ Software development is a creative process:
 - ☑ individual skills and experience is significant

Shortcomings of ISO 9001 Certification (5)

- ⌘ Many areas of software development are very specialized:
 - ☒ special expertise and experience (domain expertise) required.
- ⌘ ISO 9001
 - ☒ does not automatically lead to continuous process improvement,
 - ☒ does not automatically lead to TQM.

Shortcomings of ISO 9001 Certification (6)

- ⌘ ISO 9001 addresses mostly management aspects.
- ⌘ Techniques specific to software development have been ignored
 - ☒ Configuration management
 - ☒ Reviews
 - ☒ Release builds
 - ☒ Problem Notification system
 - ☒ Intranets

SEI Capability Maturity Model

- ⌘ Developed by Software Engineering Institute (SEI) of the Carnegie Mellon University, USA:
 - ☑ to assist the U.S. Department of Defense (DoD) in software acquisition.
 - ☑ The rationale was to include:
 - ✗ likely contractor performance as a factor in contract awards.

SEI Capability Maturity Model

- ⌘ Major DoD contractors began CMM-based process improvement initiatives:
 - ☐ as they vied for DoD contracts.
- ⌘ SEI CMM helped organizations:
 - ☐ Improve quality of software they developed
 - ☐ Realize adoption of SEI CMM model had significant business benefits.
- ⌘ Other organizations adopted CMM.

SEI Capability Maturity Model

⌘ In simple words,

☐ CMM is a model for appraising the software process maturity of a contractor into different levels.

☐ Can be used to predict the most likely outcome to be expected from the next project that the organization undertakes.

SEI Capability Maturity Model

- ⌘ Can be used in two ways:
 - ☑ Capability evaluation
 - ☑ Software process assessment.

Capability Evaluation

⌘ Provides a way to **assess** the software process capability of an organization

☑ Helps in selecting a contractor

☑ Indicates the likely contractor performance

Software Process Assessment

⌘ Used by an organization to assess its current process:

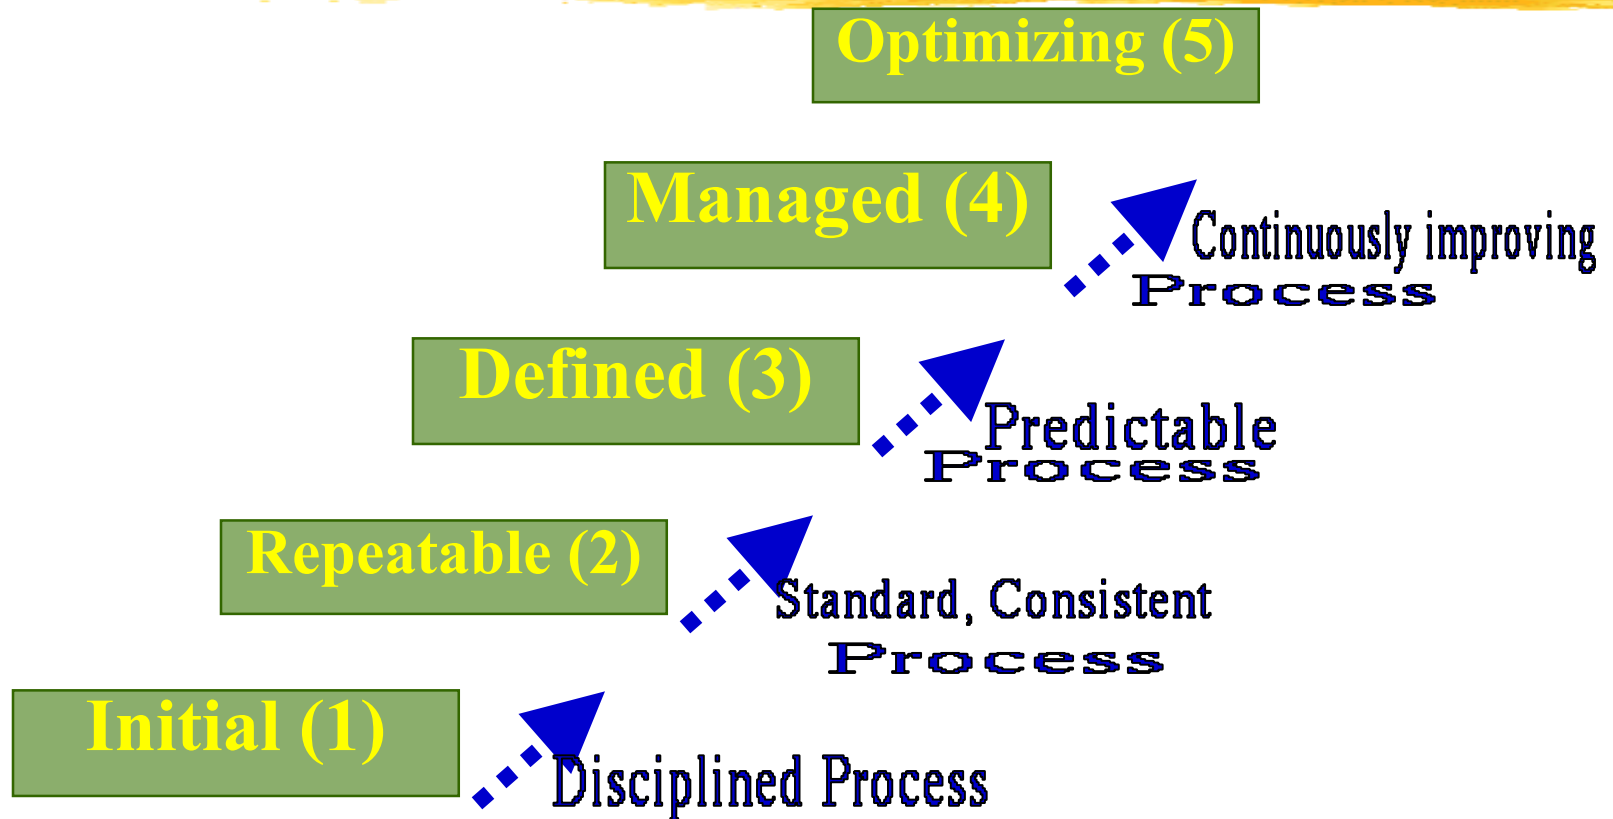

- ☑ Suggests ways to improve the process capability.

- ☑ This type of assessment is for purely internal use.

SEI Capability Maturity Model

- The SEI CMM classifies software development industries into:
 - Five maturity levels.
 - Stages are ordered so that improvements at one stage provide foundations for the next
 - Based on the pioneering work of Philip Crosby

SEI Capability Maturity Model

Level 1: (Initial)

⌘ Organization operates

☐ without any formalized process or project plans

⌘ An organization at this level is characterized by

☐ ad hoc and often chaotic activities.

Level 1: (Initial)

⌘ Software production processes are not defined,

- ☐ different engineers follow their own process

- ☐ development efforts become chaotic.

- ☐ The success of projects depend on individual efforts and heroics.

Level 2: (Repeatable)

- ⌘ Basic project management practices
 - ☑ tracking cost, schedule, and functionality are followed.
- ⌘ Size and cost estimation techniques
 - ☑ function point analysis, COCOMO, etc. used.
- ⌘ Production process is ad hoc
 - ☑ not formally defined
 - ☑ also not documented.

Level 2: (Repeatable)

- ⌘ Process used for different projects might vary between projects:
 - ☑ earlier success on projects with similar applications can be repeated.
 - ☑ Opportunity to repeat process exist when a company produces a family of products.

Level 3: (Defined)

- ⌘ Management and development activities:
 - ☑ defined and documented.
 - ☑ Common organization-wide understanding of activities, roles, and responsibilities.

Level 3: (Defined)

- ⌘ The process though defined,
⏏ process and product qualities
are not measured.
- ⌘ ISO 9001 aims at achieving
this level.

Level 4: (Managed)

- ⌘ Quantitative quality goals for products are set.
- ⌘ Software process and product quality are measured:
 - ☑ The measured values are used to control the product quality.
 - ☑ Results of measurement used to evaluate project performance
 - ☒ rather than improve process.

Level 4: (Managed)

- ⌘ Organization sets quantitative quality goals
- ⌘ World-wide about 100 organizations assessed at this level.

Level 5: (Optimizing)

⌘ Statistics collected from process and product measurements are analyzed:

☑ continuous process improvement based on the measurements.

☑ Known types of defects are prevented from recurring by tuning the process

☑ lessons learned from specific projects incorporated into the process

Level 5: (Optimizing)

⌘ Identify best software engineering practices and innovations:

☑ tools, methods, or process are identified

☑ transferred throughout the organization

⌘ World-wide about 50 organizations have been assessed at this level.

Key Process Areas

- ⌘ Each level is associated with a key process area (KPA) identifies
 - ▢ where an organization at the previous level must focus to reach this level

Level 2 KPAs

⌘ Software project planning

☑ Size, cost, schedule.

☑ project monitoring

⌘ Configuration management

⌘ Subcontract management

Level 3 KPAs

- ⌘ Process definition and documentation
- ⌘ Reviews
- ⌘ Training program

Level 4 KPAs

⌘ Quantitative measurements

⌘ Process management

Level 5 KPAs

- ⌘ Defect prevention
- ⌘ Technology change management
- ⌘ Process change management

Comparison between ISO 9001 and SEI CMM

- ⌘ ISO 9001 awarded by an international standards body
 - ☑ can be quoted in official documents and communications
- ⌘ SEI CMM assessment is purely for internal use.

Comparison between ISO 9001 and SEI CMM

⌘ SEI CMM was developed specifically for software industry:

- ☑ addresses many issues specific to software industry.

⌘ SEI goes beyond quality assurance

- ☑ aims for TQM

- ☑ ISO 9001 correspond to SEI level 3.

Comparison between ISO 9001 and SEI CMM

⌘ SEI CMM provides a list of key areas

☐ on which to focus to take an organization from one level to the other

⌘ Provides a way for gradual quality improvements over several stages.

☐ e.g trying to implement a defined process before a repeatable process:

☒ counterproductive as managers are overwhelmed by schedule and budget pressure.

Remarks on Quality Model Usage

⌘ Highly systematic and measured approach to software development process suits certain circumstances

☒ negotiated software, safety-critical software, etc

⌘ What about small organizations?

☒ Typically handle applications such as internet, e-comm.

☒ without an established product range,

☒ without revenue base, experience on past projects, etc.

☒ CMM may be incompatible

Small Organizations

⌘ Small organizations tend to believe:

☑ We are all competent people hired to do a job, we can't afford training

☑ We all communicate with one another

☒ Osmosis works because we are so close

☑ We are all heroes

☒ We do what needs to be done

☒ Therefore rules do not apply to us

Small Organizations

⌘ Often have problems:

- ☑ Undocumented requirements
- ☑ Inexperienced managers
- ☑ Documenting the product
- ☑ Resource allocation
- ☑ Training
- ☑ Peer reviews

Small Organizations

- ⌘ A two week CMM-based appraisal is probably excessive:
- ⌘ Small organizations need to operate more efficiently at lower levels of maturity
 - ☐ Must first flourish if eventually they are to mature

Personal Software Process (PSP)

- ⌘ Based on the work of Humphrey
- ⌘ PSP is a scaled down version of industrial software process
 - ☑ suitable for individual use
- ⌘ Even CMM assumes that engineers use effective personal practices

Personal Software Process (PSP)

- ⌘ A process is the set of steps for doing a job
- ⌘ The quality and productivity of an engineer
 - ⏏ largely determined by his process
- ⌘ PSP is framework that
 - ⏏ helps software engineers to measure and improve the way they work.

Personal Software Process (PSP)

- ⌘ Helps developing personal skills and methods
 - ☒ Estimating and planning method
 - ☒ Shows how to track performance against plans
 - ☒ Provides a defined process
 - ☒ can be fine tuned by individuals
 - ☒ Recognizes that a process for individual use is different from that necessary for a team project.

Time Management

⌘ Track the way you spend time

- ☑ Boring activities seem longer than actual

- ☑ Interesting activities seem short

⌘ Record time for

- ☑ Designing

- ☑ Writing code

- ☑ Compiling

- ☑ Testing

Personal Software Process (PSP)

PSP-Planning

- ⌘ Problem definition
- ⌘ Estimate max, min, and total LOC
- ⌘ Determine minutes/LOC
- ⌘ Calculate max,min, and total development times
- ⌘ Enter the plan data in project plan summary form
- ⌘ record the planned time in Log

PSP-Design

- ⌘ Design the program
- ⌘ Record the design in specified format
- ⌘ Record the Design time in time recording log

PSP-Code

- ⌘ Implement the design
- ⌘ Use a standard format for code text
- ⌘ Record the coding time in time recording log

PSP-Compile

- ⌘ Compile the program
- ⌘ Fix all the defects
- ⌘ Record compile time in time recording log

PSP-Test/Postmortem

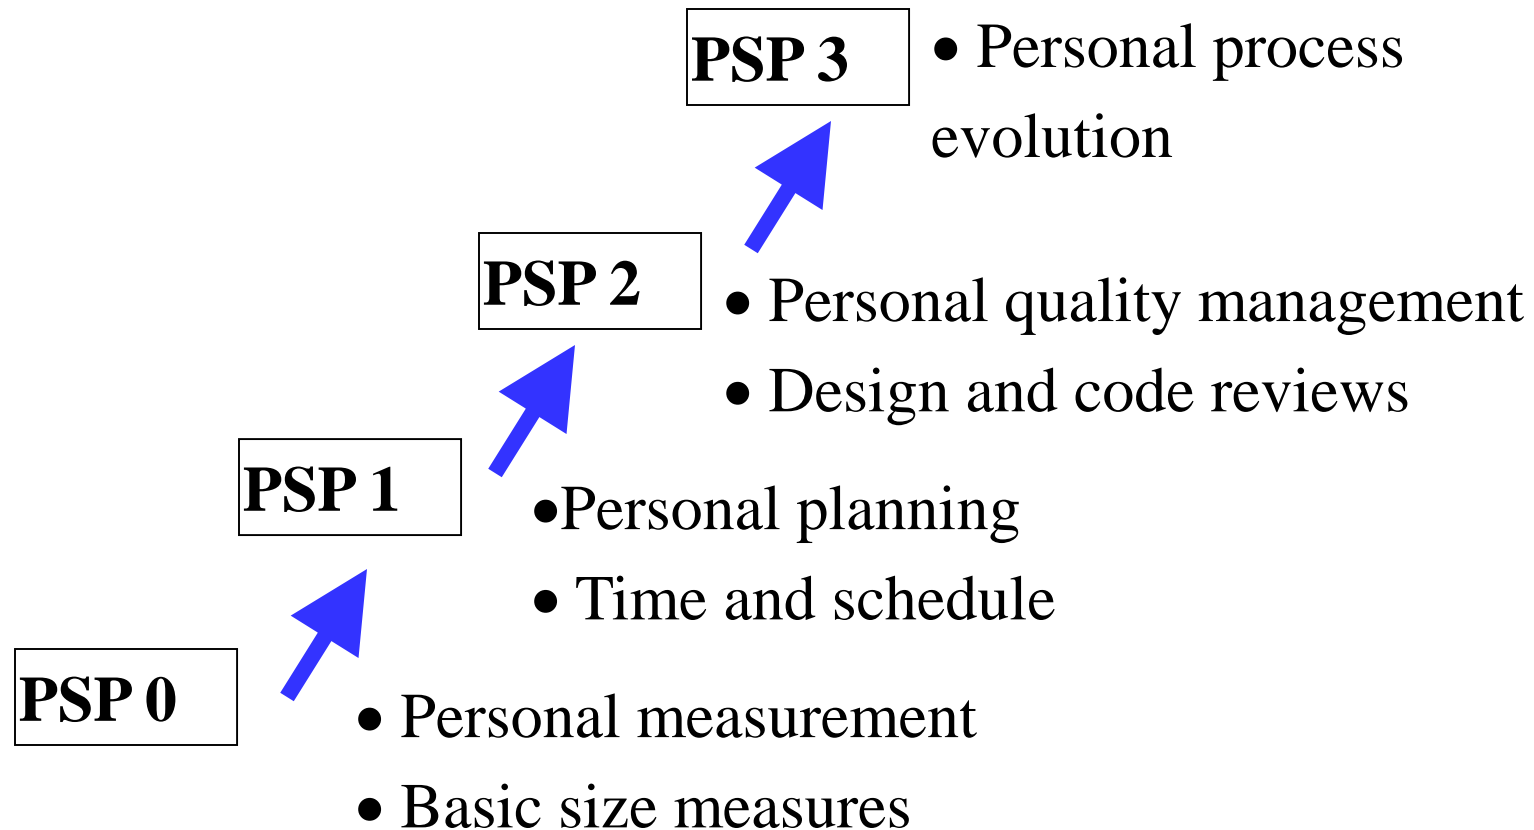

⌘ Test

- ☑ Test the program
- ☑ Fix all the defects found
- ☑ Record testing time in time recording log

⌘ Postmortem

- ☑ Complete project plan summary form with actual time and size data
- ☑ Record postmortem time in time record

Personal Software Process (PSP)

Six Sigma

⌘ Six sigma is a quantitative approach to eliminate defects

☑ Applicable to all types of industry - from manufacturing, product development, to service

⌘ The statistical representation of Six Sigma quantitatively describes

☑ how a process is performing

Six Sigma

⌘ To achieve six sigma

- ☑ a process must not produce more than 3.4 defects per million opportunities.

- ☑ 5 Sigma -> 230 defects per million

- ☑ 4 Sigma -> 6210 defects per million

⌘ Six sigma methodologies

- ☑ DMAIC (Define, Measure, Analyze, Improve, Control)

- ☑ DMADV: (Define, Measure, Analyze, Design, Verify)

Six Sigma Methodologies

⌘ The methodologies are implemented by Green belt and Black belt workers

- ☑ Supervised by Master black belt worker

⌘ Pareto Chart:

- ☑ Simple bar chart to represent defect data

- ☑ Identify the problems that occurs with greatest frequency

- ☑ or incur the highest cost

Summary

- ⌘ Evolution of quality system:
 - ☐ product inspection
 - ☐ quality control
 - ☐ quality assurance
 - ☐ total quality management (TQM)
- ⌘ Quality paradigm change:
 - ☐ from product to process

Summary

⌘ ISO 9000:

☑ basic premise:

☑ if a good process is followed

☑ good products are bound to follow

☑ provides guidelines for
establishing a quality system.

Summary

⌘ ISO 9000

- ☑ series of three standards

 - ☒ 9001, 9002, and 9003

- ☑ 9001 is applicable to software industry

Summary

⌘ SEI CMM

- ☑ developed specially for software industry
- ☑ classifies software organizations into five categories.
 - ☒ According to the maturity of their development process.

Current Trends

⌘ Many organizations have already tuned their process for

- ☑ Budget,

- ☑ Schedule, and

- ☑ Quality product.

⌘ Competition is challenging them to:

- ☑ Reduce time for delivery

- ☑ Adopt Six-Sigma methodology
